Project Title - Retail Product

Overview:

The project was related to diversified global manufacturer and solutions provider. They are delivering innovative equipment and components, consumable supplies, aftermarket parts, software and digital solutions, and support services through five operating segments: Engineered Products, Clean Energy & Fueling, Imaging & Identification, Pumps & Process Solutions and Climate & Sustainability Technologie. This same product has multiple clients

Role:

Manual: -

- Go through new JIRA tickets and assign tickets to junior QA for creating TCS.
- Test case design, Test case execution, Update Test cases according to new requirements
- Perform regression testing for every client when new product version release.

Automation: -

- Developed automation test cases based on new test case creation
- Execute existing test cases in the development environment to check everything is working fine after new deployments.
- Execute Regression suite for every client after every release on testing environments.

Technology & Tools:

- Katalon Studio
- Java, Selenium and JUnit

Challenges we faced: (In Automation)

- For every client, most of the product flow was the same, but for some clients, the payment flow was different, so we had to develop a different test flow for every client.
